

# **Multimedia**

**chapter (3)**

**Animation**

**By Atika Aldoghmi**

# Introduction to Animation

- **Animation** is the rapid display of a sequence of images of 2-D or 3-D artwork or model positions in order to create an illusion of movement.

**Animation is the creation of moving pictures one frame at a time.**

- [EX2](#)

# Introduction to Animation

- Traditional animation was time consuming and labour intensive
- Computers animation is time consuming and labour intensive, but it produces more sophisticated results
- Interactivity can also be incorporated into computer animations

▪

1. Traditional animation

2. Stop motion (frame-by-frame)

- clay animation
- cel animation

3. Computer animation

- 2D animation
- 2.3.2 3D animation

# Introduction to Animation

- One traditional method of animation was produced by creating a series of drawings that progressively change

THE ZOETROPE.

PHENAKISTOSCOPE WITH A CYCLE OF DRAWINGS TO SHOW A DOG IN MOVEMENT.

# Frame-by-Frame Animation

- One traditional method of animation was produced by creating a series of drawings that progressively change

# Cel Animation

- Another form of animation was to use transparent sheets
- The sheets were then layered one over the other to build the complete picture
- Using sheets saved redrawing the entire image every time (avoid unnecessary redrawing)
- The transparent sheet are known as cells from the word cellulose

Camera

# Clay model animation

- Clay model animation
- This is where the objects are created in clay (or sand, paper, etc.)
- They are then changed slightly for every frame

(For film this is 24 frames per second)

# Clay model animation

# Clay model animation

# Clay model animation

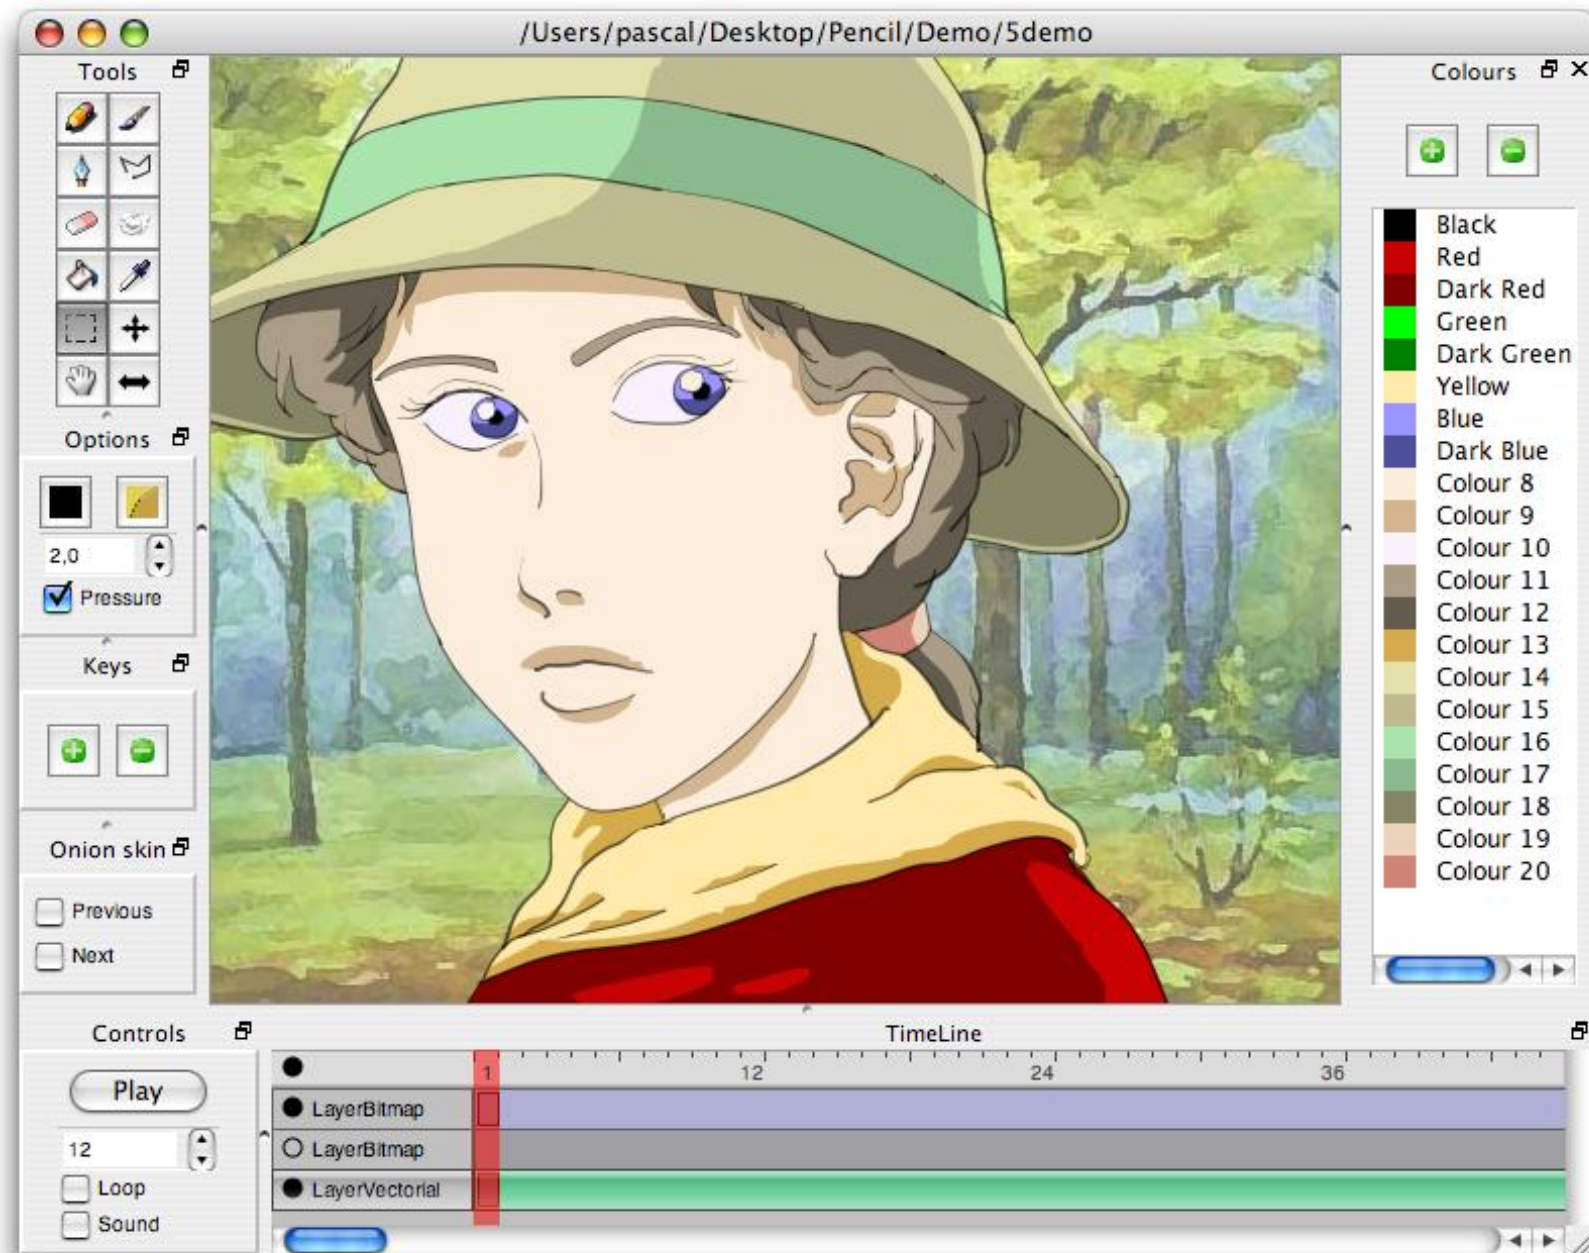

# Computer Animation

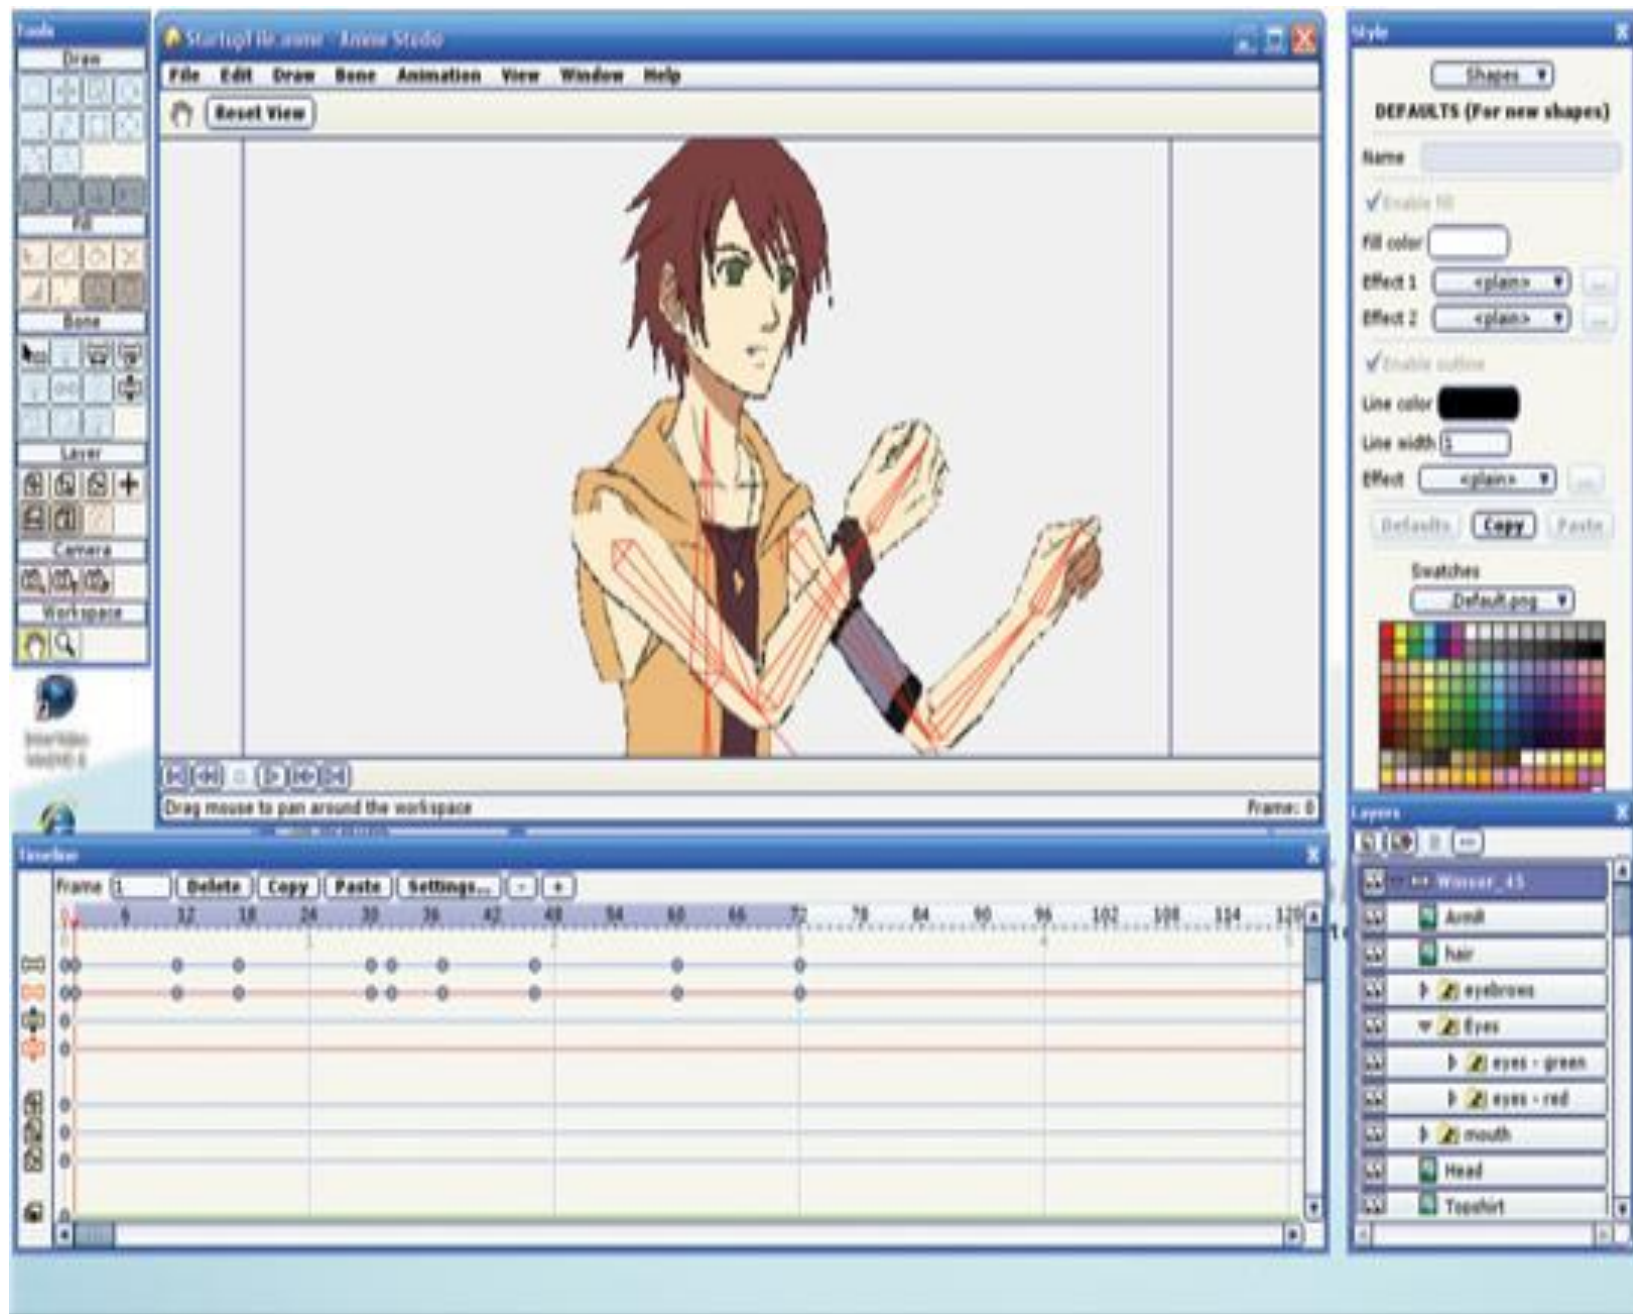

- Computer animation uses some of the systems from traditional animation
- There are three main types of 2D computer animation
  - Cast Swapping
  - Tweening
  - Scripted

# 2D computer animation

# 2D computer animation

# Cast Swapping

One cast member is animated by:

- Slightly changing it
- Swapping it with another cast member

# Tweening (Keyframing)

- A cast member is moved across the screen over a period of time
- The start and end frames are keyframes
- Any change in direction or pace is a keyframe
- The computer then generates the image in between
- This is known as tweening

# Tweening (Keyframing)

Start

End

- Location
- Color
- Size
- Linear or more complex equations

How should these frames be tweened?

Start

End

# Scripted

- The animation is created by using a script or program
- Examples of scripted animations are
  - Changing co-ordinates of objects to move them
  - Changing Colours of objects
  - Changing position and size of objects

# Making animation believable

- Action in animation involves
  - Preparation
  - Action
  - Recovery

# Making animation believable

A person jumping does not just stand and jump, they do the following:

- Preparation - The person bends and swings their arm back
- Action - Jumps
- Recovery - Stands to regain balance

# Making animation believable

- A ball
  - Falls
  - Bounces
  - Recovers
- As the ball touches the ground the ball does not remain a circle it will squash with force

# Making animation believable

- The ball makes a noise as it hits the ground
- The person definitely makes a noise as they jumps
- So animations should include sounds
- To Make the animation believable it should include sounds

# Making animation believable

- Sound is essential to making animations believable
- People will fill in information if they are provided with the correct sound effect (car horn or type squeal off screen)

# Lip Synchronisation

- It is important to synchronise sound and facial expressions
- The first and last words are most important
- The shorter the phrase the more accurate the synchronisation
- There are various mouth positions for different sounds

# Lip Synchronisation

- Use at least two mouth shapes, open and closed

- a\_i

- c\_d\_g\_k\_n\_r\_s\_th\_y\_z

# Lip Synchronisation

- e

- f\_v\_d\_th

- l\_d\_th

- m\_b\_p

- o

- u

- w\_q

- silence

# Walk Cycles

# Morphing

- that changes (or morphs) one image into another through a seamless transition.
- Most often it is used to depict one person turning into another through technological means or as part of a fantasy or surreal sequence.
- Control points are used in order to stretch (and color) the source image smoothly to the destination image

# Morphing

Source

Destination
